

Membrane Recycling

Take-back, recovery and documentation for used membrane modules

Membranes are consumables. At the end of their service life the question is where the modules go. MemRe handles assessment, logistics, recovery and documentation.

How it works

- You tell us what you need. A short note is enough: plant, membrane type, date of replacement.
- We assess the situation. What matters is type, quantity, condition and any possible contamination. This qualified evaluation is at the core of our service.
- Labelling and logistics. Modules are clearly identified, we plan the transport and support you on site.
- Collection at your site.
- Recovery and proof. Recovery takes place through a route bound by EU waste legislation. You receive a confirmation of proper recovery. Up to 85 percent of the returned material is recovered.

What we need from you

About the plant: name and location, operator, current feed analysis, reason for the replacement. About the membranes: manufacturer, year, size, serial numbers, installation and planned removal, operating hours, drained yes or no.

About possible contamination: heavy metals, toxins, pharmaceuticals, nano components, radionuclides. If the contamination is unknown, say so. An open statement is better than a guess, because it protects everyone further down the chain.

Contact

Write to office@memre.de. We reply promptly. If a plant is down unexpectedly, note it in the subject line and we treat it with priority.
